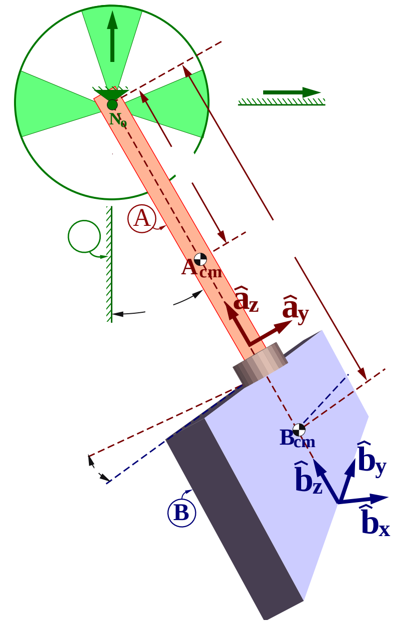
Motivating example (MIPSI): Babyboot



Model

The figure to the right is a schematic representation of a swinging babyboot attached by a shoelace to a rigid support. The mechanical model of the babyboot consists of a thin uniform rod A attached to a fixed support N by a revolute joint, and a uniform plate B connected to A with a second revolute joint so that B can rotate freely about A's axis.
Note: The revolute joints' axes are ***perpendicular***, not parallel.

- **Bodies**: The rod and plate are ______ (inflexible/undeformable).
- **Connections**: The revolute joints are ______ (massless, frictionless, with no slop or flexibility).
- **Force**: ______ is uniform and constant.
  Other contact forces (e.g., ______) and distance forces (e.g., ______) are negligible.
- **Newtonian reference frame**: ______

Identifiers

Right-handed sets of unit vectors $\widehat{\mathbf{n}}_x, \widehat{\mathbf{n}}_y, \widehat{\mathbf{n}}_z$; $\widehat{\mathbf{a}}_x, \widehat{\mathbf{a}}_y, \widehat{\mathbf{a}}_z$; and $\widehat{\mathbf{b}}_x, \widehat{\mathbf{b}}_y, \widehat{\mathbf{b}}_z$ are fixed in N, A, and B, respectively, with $\widehat{\mathbf{n}}_x = \widehat{\mathbf{a}}_x$ parallel to the revolute axis joining A to N, $\widehat{\mathbf{n}}_z$ vertically upward, $\widehat{\mathbf{a}}_z = \widehat{\mathbf{b}}_z$ parallel to the rod's long axis (and the revolute axis joining B to A), and $\widehat{\mathbf{b}}_z$ perpendicular to plate B.

Quantity	Symbol	Type	Value
Earth's gravitational constant	g	Constant	9.81 m/s^2
Distance between N_o and A_{cm}	L_A	Constant	7.5 cm
Distance between N_o and B_{cm}			20 cm
Mass of A			0.01 kg
Mass of B			0.1 kg
A's moment of inertia about A_{cm} for $\widehat{\mathbf{a}}_x$	I^A	Constant	0.05 kg∗cm^2
B's moment of inertia about B_{cm} for $\widehat{\mathbf{b}}_x$	I^B_x	Constant	2.5 kg∗cm^2
B's moment of inertia about B_{cm} for $\widehat{\mathbf{b}}_y$		Constant	0.5 kg∗cm^2
B's moment of inertia about B_{cm} for $\widehat{\mathbf{b}}_z$		Constant	2.0 kg∗cm^2
Angle from $\widehat{\mathbf{n}}_z$ to $\widehat{\mathbf{a}}_z$ with $+\widehat{\mathbf{n}}_x$ sense			Varies
Angle from $\widehat{\mathbf{a}}_y$ to $\widehat{\mathbf{b}}_y$ with $+\widehat{\mathbf{a}}_z$ sense			Varies
Time	t		Varies

Physics

Physics from www.MotionGenesis.com ⇒ Get Started ⇒ Chaotic Pendulum (Babyboot).

The ODEs (ordinary differential equations) governing the motion of this mechanical system are[11]

$$\ddot{q}_A = \frac{2\,\dot{q}_A\,\dot{q}_B\,\sin(q_B)\,\cos(q_B)\,\left(\mathrm{I}^B_x - \mathrm{I}^B_y\right) \;-\; \left(m^A L_A + m^B L_B\right) g \sin(q_A)}{\mathrm{I}^A + m^A L_A^2 + m^B L_B^2 + \mathrm{I}^B_x \cos^2(q_B) + \mathrm{I}^B_y \sin^2(q_B)}$$

$$\ddot{q}_B = \frac{-\dot{q}_A{}^2\,\sin(q_B)\,\cos(q_B)\,(\mathrm{I}^B_x - \mathrm{I}^B_y)}{\mathrm{I}^B_z}$$

[11] Four methods for forming equations of motion are: ***Free-body diagrams*** of A and B (which is inefficient as it introduces up to 10 unknown force/torque measures); D'Alembert's method (***road maps*** of Section 22.6) which efficiently forms the two equations shown for $\ddot{q}_A$ and $\ddot{q}_B$ (but require a clever selection of systems, points, and unit vectors); ***Lagrange's equations*** (an energy-based method that automates D'Alembert's cleverness); ***Kane's equations*** (a modern efficient blend of D'Alembert and Lagrange).

Simplify and solve

Computers has revolutionized the solution of differential equations. There are a many numerical algorithms for solving nonlinear, coupled, variable coefficient, ODEs (ordinary differential equations) including Euler's method, predictor-corrector, Runga-Kutta, etc. In addition, there are many programs (MATLAB®, **M**otion**G**enesis, WolframAlpha, etc.) that make it easy to solve ODEs.

Computer (numerical) solution of ODEs with MotionGenesis (with plotting)

```
Variable  qA'', qB''      % Angles and first/second time-derivatives.
%--------------------------------------------------------------------
qA'' = 2*( 508.89*sin(qA) - sin(qB)*cos(qB)*qA'*qB' ) / (-21.556 + sin(qB)^2)
qB'' = -sin(qB)*cos(qB)*qA'^2
%--------------------------------------------------------------------
Input  tFinal = 10 sec, tStep = 0.02 sec, absError = 1.0E-07
Input  qA = 90 deg,  qB = 1.0 deg,  qA' = 0.0 rad/sec,  qB' = 0.0 rad/sec
OutputPlot  t sec,  qA degrees,  qB degrees

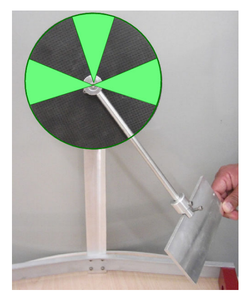
Interpret

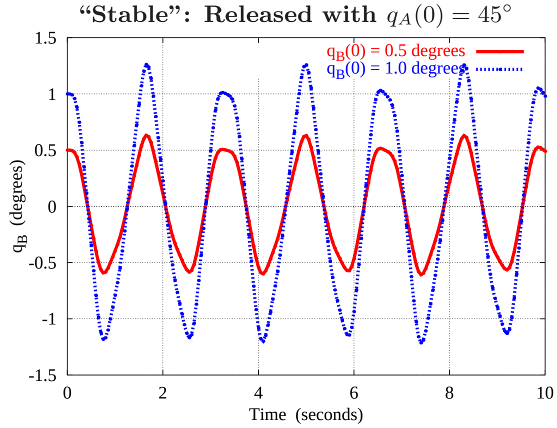
The solution to these differential equations reveals this simple system has strange, non-intuitive motion.[12] For certain initial values of q_A, the motion of plate B is well-behaved and "stable". Alternately, for other initial values of q_A, B's motion is **"chaotic"** – meaning that a small variation in the initial value of q_B or numerical integration inaccuracies lead to dramatically different results (these ODEs are used to test the accuracy of numerical integrators – the plots below required a numerical integrator error of absError $= 1 \times 10^{-7}$).

The following chart and figure to the right shows this system's regions of stability (**black**) and instability (**green**). Notice the **"chaotic"** plot below shows q_B is ***very*** sensitive to initial values. A 0.5° change in the initial value of $q_B(0)$ results in more than a 2000° difference in the value of $q_B(t = 10)$!

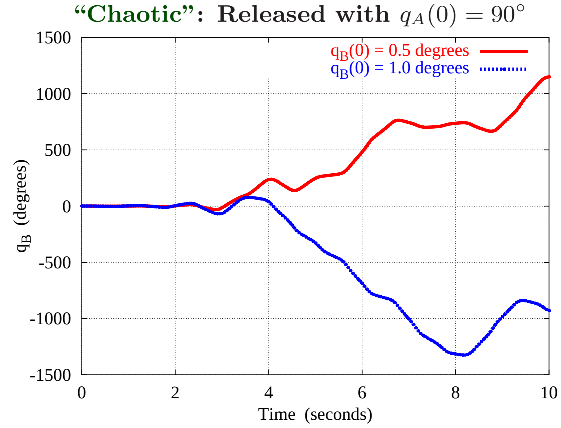


Initial value of q_A			Stability	
0°	$\leq q_A(0) \leq$	71.3°	**Stable**	**black**
71.4°	$\leq \mathbf{q_A(0)} \leq$	**111.77°**	**Unstable**	**green**
111.78°	$\leq q_A(0) \leq$	159.9°	**Stable**	**black**
160.0°	$\leq \mathbf{q_A(0)} \leq$	**180.0°**	**Unstable**	**green**

"Stable": Released with $q_A(0) = 45°$



"Chaotic": Released with $q_A(0) = 90°$



[12] More information about this problem is in "Mechanical Demonstration of Mathematical Stability and Instability", *International Journal of Engineering Education (Journal of Mechanical Engineering Education)*, Vol. 2, No. 4, 1974, pp. 45-47, by Thomas R. Kane. Or visit www.MotionGenesis.com ⇒ Get Started ⇒ Chaotic Pendulum (Babyboot).
